# ABOUT SMARTWATCH®

SmartWatch is an easy-to-use wristwatch that continuously monitors movements and instantly alerts family members and caregivers upon the onset of repetitive shaking motion.

Water resistant and splendidly lightweight, SmartWatch is a hassle-free addition to any busy lifestyle that provides invaluable peace of mind.

*“The watch has given me and my son our lives back.”*  
–KRISTEN B., CALIFORNIA

## HOW IT WORKS

When SmartWatch detects repetitive shaking motion, it signals the user’s Android phone to send text and phone call alerts to whomever the SmartWatch user designates, such as multiple family members and care providers.

Within seconds, family members receive these alerts, which include the date, time, location and duration of the event. SmartWatch users can also summon help with the push of a button. Alerts can be sent to any phone, anywhere, and detailed reports of each event can be securely accessed for later review with physicians.

Help Button	●	●
Event Recording and Secure Access	●	●
Audible Alarm	●	●
GPS Location		●
Snooze Button		●
Multiple Contacts		●
Medication Reminders		●

## CLINICAL VALIDATION

The SmartWatch has been evaluated and successfully validated in clinical studies conducted at leading medical institutions such as Stanford and University of California, San Francisco (UCSF).

In addition, SmartWatch is being used in clinical studies at NYU Langone Medical Center, Boston Children’s Hospital and the University of Virginia. These studies are leveraging the ability of the SmartWatch to provide data on seizures that was never before possible in an outpatient setting.

*“The SmartWatch saved our daughter’s life last week. On only the 3rd night wearing the watch, we woke to an alert at 3:40am. Never before did we think our daughter had seizures in her sleep, but we walked in on a grand mal seizure. It was so prolonged that an ambulance and emergency room visit were necessary.”*  
–JILL G., MICHIGAN
