

### PRINCIPLE AND INTENDED USE

The Capillary Transfer Tube is a plastic tube, with a strategically positioned air vent on the sidewall of the tube, that provides automatic air venting and sample volume control.

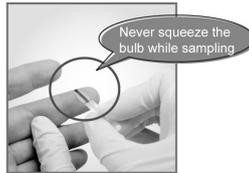

### INSTRUCTIONS FOR USE

1. When using a capillary tube, it is important not to squeeze the bulb. Holding the tube slightly downward, touch the tip of the capillary tube to the blood drop. The blood will automatically be drawn in to the black fill line and stop.

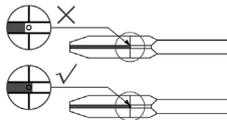

Wrong

Correct

**Note:** Never squeeze the capillary transfer tube while collecting the blood sample.

2. Make sure that blood covers the black line and the air vent, or it will be difficult to squeeze the blood out.

3. Align the tip of the capillary transfer tube with the sample well on the test cartridge. Squeeze the bulb to apply the blood sample to the sample well.

**Note:** Capillary blood should be tested immediately after collection.

Do not reuse the capillary transfer tube.
