A range of benefits you'll be comfortable with

Setting a new standard in apparel

The Affordable Care Act has brought change to Medicare reimbursement by creating pay-for-performance metrics in programs such as the Hospital Acquired Conditions Reduction Program and the Hospital Value-Based Purchasing Program. Both of these programs include metrics for multiple types of perioperative patient infections that directly impact reimbursement rates. Single-use scrubs and warm-up jackets from BARRIER® provide an unquestionably hygienic and comfortable solution to help protect your patients and maximize reimbursement.

The AORN Recommended Practice for Surgical Attire notes that scrubs with smaller fabric pores are clinically proven to reduce the amount of bacteria shed into the air by two to five times. Fabric pore size is critical as each healthcare worker loses a complete layer of skin every four days (about 10,000 skin squames every day), and up to five to ten percent of these skin squames carry bacteria.¹

Unlike reusable woven scrubs, BARRIER Extra Comfort fabric skips the yarn and weaving process to significantly reduce the fabric pore size and create a soft, breathable material.

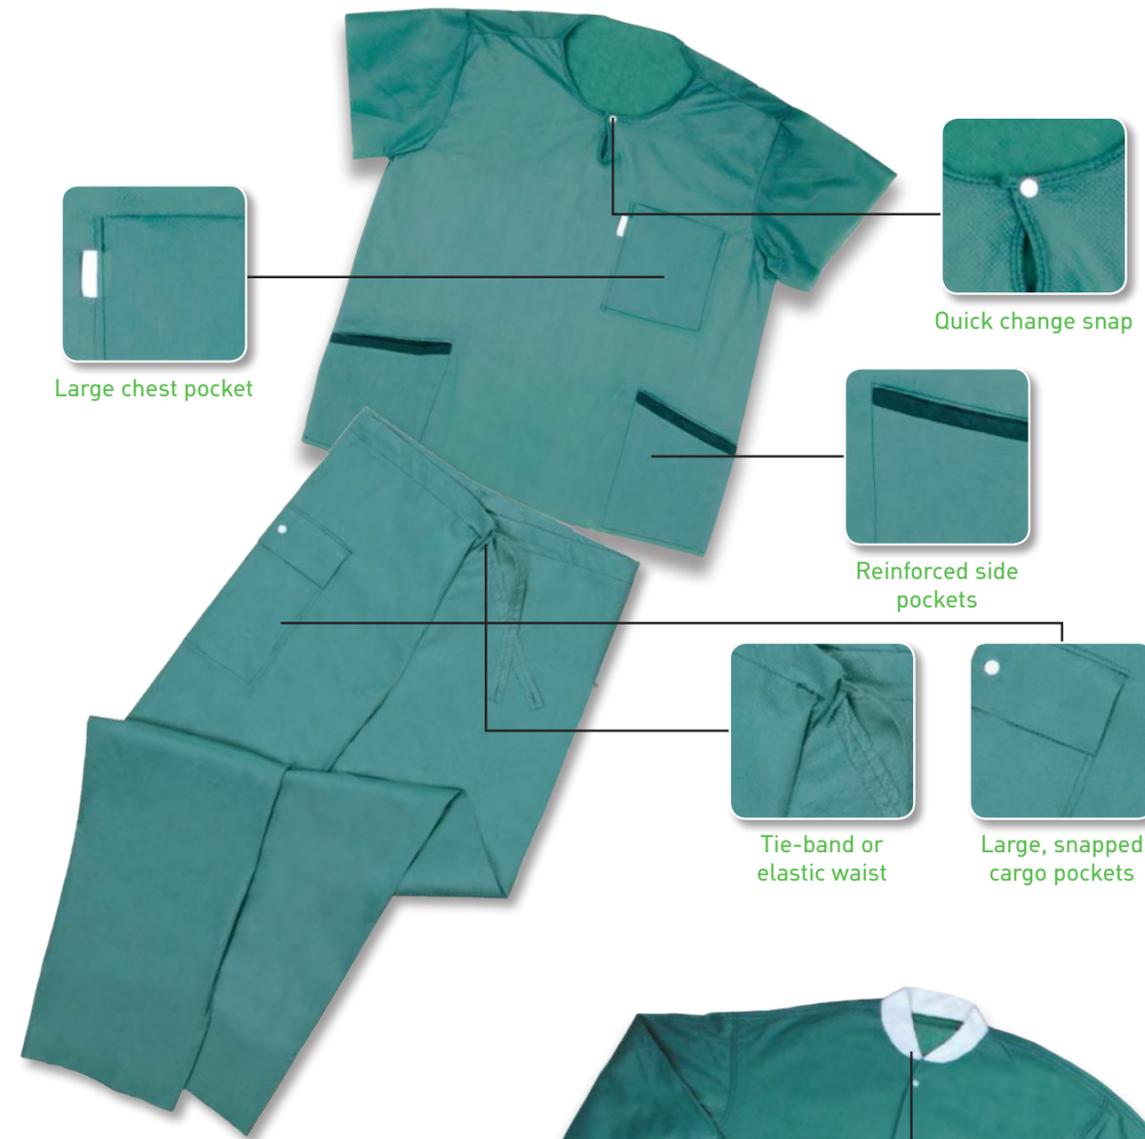

BARRIER Extra Comfort provides up to three times greater bacterial protection and up to four times greater fluid protection than leading reusable scrubs.²

Suggested Uses

- O.R. Floors
- Emergency Department
- Labor and Delivery
- Emergency Preparedness
- Intensive Care Unit
- Psychiatric Ward
- Pathology
- Lab Testing

Unparalleled Comfort

- Made of exclusive Unisoft™ material
- Lightweight
- Soft feel of cotton
- Breathable
- Non-latex
- Anti-static treated
- Quiet

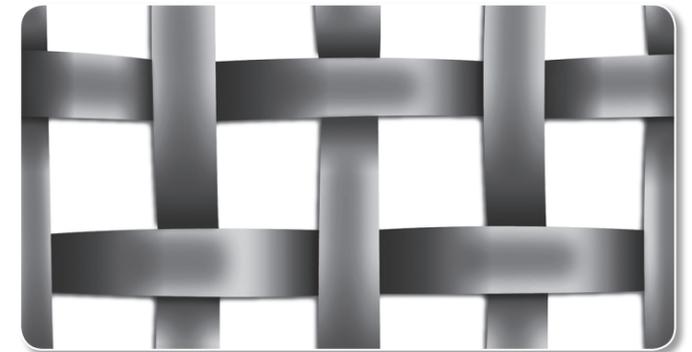

What is Unisoft™ material?

Woven reusable fabrics are created from a yarn and weaving manufacturing process that creates a distinct fabric pattern and pore size. The larger the pore size, the more freely fluids and particles flow through the fabric.

BARRIER® Extra Comfort scrubs and warm-up jackets are made from a unique, nonwoven spunbond material called Unisoft™. Our manufacturing method skips the yarn and weaving process by bonding together three layers of randomly overlapping fibers under intense heat. This process significantly reduces the fabric's pore size to minimize contamination and keep breathability high.

Reusable Woven Fabric
